## Notes

(1) The program should be run in RPN mode, as results in ALG mode are unknown.
(2) Latitudes and longitudes should be entered in HP notation, i.e., DDD.MMSS. The grid convergence is displayed in HP notation.
(3) The program may be used for any Transverse Mercator projection, if the appropriate parameters are known. Similarly, any ellipsoid may be used, if its a and $\mathrm{e}^{2}$ parameters are known. Parameters for a wide range of ellipsoids, all UTM zones and all SPCS TM zones are included at the end of this document.

Latitudes in the southern hemisphere are negative. Longitudes west of Greenwich are negative, i.e., all longitudes in North America. It is critical to enter the correct sign in the calculator when entering values.

Lines with **** are comments only, and should not be entered into the calculator. They are there to make program entry a little easier.
(6) This program is long and often appears to be a stream of meaningless commands. This means that it may be more prone to errors when being entered. It is suggested that the program be entered using the given constants, tested (and the checksum checked), and when it is satisfactory, the constants at the start of the program can be changed to those most suitable for the bulk of the expected work.

In order to reduce the apparent length of the program (which otherwise would have been well over 600 lines), equations were used for the bulk of the computations. Some equations are too long to fit on a single line in the above listing, so are continued to the line below (Y126, Y152, Y165. In this case, the line number is replaced by a $\dagger$ and a $\ldots$ appears at the start of the continuing line. Neither the $\dagger$ nor the $\ldots$ should be entered into the calculator.

The use of equations, rather than direct instruction code, does slow the computation process a little, but makes the program a bit shorter and so possibly easier to enter.

The program allows the user to run additional points after each is completed, by prompting. If another point is to be processed, the user also has the option to move to a new zone and ellipsoid, otherwise the previous ellipsoid and projection parameters are used. Respond 0 for 'NO' and 1 for 'YES' at the Q? prompt. If the user chooses to enter another point, the previous data entered is displayed at the prompts, but angular data are stored in decimal degrees. This should be re-entered in HP notation (or quickly converted with the $r \rightarrow$ HMS key sequence), even if the same data is being used, because the program will convert the values to decimal degrees again, and so produce erroneous results.
(9) There are two lines where the calculator's mode is changed from DEGREES to RADIANS, and vice versa. The instructions for these lines (Y094 and Y167) are keyed in using the MODE button. A note about this is included on the relevant line of the code, in red, to avoid confusion with the $\rightarrow$ RAD and $\rightarrow$ DEG function, which are used elsewhere in the program.
(10) The program appears to work correctly, as tested. However, the grid convergence result has the opposite sign to that produced by the NGS on-line Lat/Long to SPCS conversion package at: http://www.ngs.noaa.gov/cgi-bin/spc_getpc.prl The formulae are correct in this program, and the results agree with the sign convention of Redfearn's formulae, as well as the normal usage of the grid convergence (converting between grid and true azimuths). I am not sure why the NGS program has the opposite sign, but I have asked NGS about it. Until this difference is resolved, be aware that the sign could be the opposite, and work out the correct sign from first principles.

## Theory

Converting from cartesian co-ordinates ( $\mathrm{E}, \mathrm{N}$ or $\mathrm{X}, \mathrm{Y}$ ) to geographical co-ordinates (latitude and longitude) on a Transverse Mercator projection is a straightforward transformation, if somewhat longwinded. This program uses equations to help reduce the bulk of the program a little.

Given that we have $\mathrm{a}, \mathrm{e}^{2}, \phi, \mathrm{k}_{0}, \lambda$ and $\lambda_{0}$, we can use the following expressions for the conversion. These are Redfearn's Formulae. Note that these use an extra term in the computations, compared to Snyder's book (1987), but this will make a negligible difference in the overall values. The results will be a little different to the tabulated values for SPCS, too, owing to the limitations on the SPCS 27 computations. Remembering that the allowable distortion in the SPCS was to be no more than 1 in 10,000 , it is acceptable to drop the final term in the formulae, as this doesn't degrade the formulae by anywhere near 1 in 10,000 . Such modified formulae will then agree with Snyder's formulae, remembering that Snyder was setting up the formulae for mapping, rather than geodetic use.

For UTM computations, you should use the full number of terms. This is because there is no 'legal' tolerance of distortion in the conversion process. UTM co-ordinates are now printed on 1:24,000 quadrangle maps, with either a grid/graticule or marginal ticks. These UTM co-ordinates are often on the NAD27 datum and need to be converted to NAD83 before they can be used. While there is a marginal note concerning the conversion of latitude and longitude from NAD27 to NAD83 on many of the more recent mapsheets, this value does not apply to the UTM co-ordinates (or the SPCS co-ordinates). This is because the latitude and longitude values are, in effect, figured from the origin in Kansas, while the UTM Northing co-ordinates are figured from the Equator. SPCS northings are figured from the zone origin, so will have a different shift for each zone. You should convert the co-ordinates to latitude and longitude for the appropriate system, convert these to NAD83, then convert to UTM or SPCS TM co-ordinates. An approximate set of shifts for UTM can be found in a paper by Welch, R., and Homsey, A., "Datum Shifts for UTM Co-ordinates," in the Photogrammetric Engineering and Remote Sensing journal, Volume 63, No. 4, pp. 371-375, published in 1997.

## Conversion Formulae

Starting with the following general formulae, these can be applied in the following conversion formulae.

$$
\begin{aligned}
& \text { For UTM, } \mathrm{E}_{0}=500000 \cdot 000 \text { meters.) } \\
& \text { UTM in the northern hemisphere, } \mathrm{N}_{0}=0 \text {; for UTM in the southern } \\
& \text { hemisphere, } \mathrm{N}_{0}=10000000 \cdot 000 \text { meters.) } \\
& v=\text { radius of curvature in the prime vertical at } \phi \text {; i.e. } v=\frac{\mathrm{a}}{\sqrt{1-\mathrm{e}^{2} \sin ^{2} \phi}} \\
& \rho=\frac{\mathrm{a}\left(1-\mathrm{e}^{2}\right)}{\left(1-\mathrm{e}^{2} \sin ^{2} \phi\right)^{\frac{3}{2}}}=\text { radius of curvature in the meridian at } \phi \\
& \omega=\lambda-\lambda_{0} \\
& \psi=\frac{v}{\rho} \text { i.e. ratio of the radii of curvature at } \phi
\end{aligned}
$$

$\mathrm{t}=\tan \phi$
$\mathrm{m}=$ meridian distance from equator, computed using the following expression
$\mathrm{m}=\mathrm{a}\left(\mathrm{A}_{0} \phi-\mathrm{A}_{2} \sin 2 \phi+\mathrm{A}_{4} \sin 4 \phi-\mathrm{A}_{6} \sin 6 \phi\right)$
where $\phi$ is in radians and

$$
\begin{aligned}
& A_{0}=1-\frac{\mathrm{e}^{2}}{4}-\frac{3 \mathrm{e}^{4}}{64}-\frac{5 \mathrm{e}^{6}}{256} \\
& \mathrm{~A}_{2}=\frac{3}{8}\left(\mathrm{e}^{2}+\frac{\mathrm{e}^{4}}{4}+\frac{15 \mathrm{e}^{6}}{128}\right) \\
& \mathrm{A}_{4}=\frac{15}{256}\left(\mathrm{e}^{4}+\frac{3 \mathrm{e}^{6}}{4}\right) \\
& \mathrm{A}_{6}=\frac{35 \mathrm{e}^{6}}{3072}
\end{aligned}
$$

With the appropriate values for ellipsoids and scale factors, these formulae will work for any Transverse Mercator projection: UTM, SPCS, AMG, MGA or whatever.

In order to convert the given northing to latitude, we first need to calculate what is known as the footpoint latitude, $\phi^{\prime}$, which is the latitude for which the meridian distance is equal to $\frac{\mathrm{N}^{\prime}}{\mathrm{k}_{0}}$. This value can be calculated directly provided three other values, namely $\mathrm{n}, \mathrm{G}$ and $\sigma$ are calculated first. The choice of variable names for these three values is historical and isn't related to any other use of them.

$$
\begin{aligned}
& \mathrm{n}=\frac{\mathrm{a}-\mathrm{b}}{\mathrm{a}+\mathrm{b}} \quad \text { where } \mathrm{a} \text { and } \mathrm{b} \text { are the semi-major and semi-minor axes } \\
& \mathrm{b}=\mathrm{a} \sqrt{1-\mathrm{e}^{2}} \\
& \mathrm{G}=\mathrm{a}(1-\mathrm{n})\left(1-\mathrm{n}^{2}\right)\left(1+\frac{9}{4} \mathrm{n}^{2}+\frac{225}{64} \mathrm{n}^{4}\right) \frac{\pi}{180} \\
&=\text { mean length of an arc of one degree of the meridian } \\
& \begin{aligned}
\sigma & =\frac{\mathrm{m} \pi}{180 \mathrm{G}} \quad \text { use } \mathrm{m}=\frac{\mathrm{N}^{\prime}}{\mathrm{k}_{0}}
\end{aligned} \\
& \begin{aligned}
\phi^{\prime} & =\sigma \\
& +\left(\frac{3 \mathrm{n}}{2}-\frac{27 \mathrm{n}^{3}}{32}\right) \sin 2 \sigma \\
& +\left(\frac{21 \mathrm{n}^{2}}{16}-\frac{55 \mathrm{n}^{4}}{32}\right) \sin 4 \sigma \\
& +\left(\frac{151 \mathrm{n}^{3}}{96}\right) \sin 6 \sigma \\
& +\left(\frac{1097 \mathrm{n}^{4}}{512}\right) \sin 8 \sigma
\end{aligned}
\end{aligned}
$$

With these values we can calculate the geographical co-ordinates directly. Note that $\mathrm{t}^{\prime}, \psi^{\prime}, \rho^{\prime}$ and $v^{\prime}$ are functions of the foot-point latitude and using the same formulae as listed above.

## Latitude (in radians)

Let $x=\frac{E^{\prime}}{k_{0} v^{\prime}}$

$$
\begin{aligned}
\phi=\phi^{\prime} & -\frac{t^{\prime}}{\mathrm{k}_{0} \rho^{\prime}} x \frac{\mathrm{E}^{\prime}}{2} \\
& +\frac{\mathrm{t}^{\prime}}{\mathrm{k}_{0} \rho^{\prime}} \frac{x^{3} \mathrm{E}^{\prime}}{24}\left[-4 \psi^{\prime 2}+9 \psi^{\prime}\left(1-\mathrm{t}^{\prime 2}\right)+12 \mathrm{t}^{\prime 2}\right] \\
& -\frac{\mathrm{t}^{\prime}}{\mathrm{k}_{0} \rho^{\prime}} \frac{\mathrm{x}^{5} \mathrm{E}^{\prime}}{720}\left[8 \psi^{\prime 4}\left(11-24 \mathrm{t}^{\prime 2}\right)-12 \psi^{\prime 3}\left(21-71 \mathrm{t}^{\prime 2}\right)+15 \psi^{\prime 2}\left(15-98 \mathrm{t}^{\prime 2}+15 \mathrm{t}^{\prime 4}\right)\right. \\
& \left.+180 \psi^{\prime}\left(5 \mathrm{t}^{\prime 2}-3 \mathrm{t}^{\prime 4}\right)+360 \mathrm{t}^{\prime 4}\right]
\end{aligned}
$$

Longitude (in radians)
Let $x=\frac{E^{\prime}}{k_{0} v^{\prime}}$
$\omega=\sec \phi^{\prime} \mathrm{x}$

$$
\begin{aligned}
& -\sec \phi^{\prime} \frac{x^{3}}{6}\left(\psi^{\prime}+2 \mathrm{t}^{\prime 2}\right) \\
& +\sec \phi^{\prime} \frac{\mathrm{x}^{5}}{120}\left[-4 \psi^{\prime 3}\left(1-6 \mathrm{t}^{\prime 2}\right)+\psi^{\prime 2}\left(9-68 \mathrm{t}^{\prime 2}\right)+72 \psi^{\prime} \mathrm{t}^{\prime 2}+24 \mathrm{t}^{\prime 4}\right] \\
& -\sec \phi^{\prime} \frac{\mathrm{x}^{7}}{5040}\left(61+662 \mathrm{t}^{\prime 2}+1320 \mathrm{t}^{\prime 4}+720 \mathrm{t}^{\prime 6}\right)
\end{aligned}
$$

Grid Convergence (in radians)
Let $x=\frac{E^{\prime}}{k_{0} v^{\prime}}$
$\gamma=\quad-\mathrm{t}^{\prime} \mathrm{x}$

$$
+\mathrm{t}^{\prime} \frac{\mathrm{x}^{3}}{3}\left(-2 \psi^{\prime 2}+3 \psi^{\prime}+\mathrm{t}^{\prime 2}\right)
$$

$$
-t^{\prime} \frac{x^{5}}{15}\left[\psi^{\prime 4}\left(11-24 t^{\prime 2}\right)-3 \psi^{\prime 3}\left(8-23 t^{\prime 2}\right)+5 \psi^{\prime 2}\left(3-14 t^{\prime 2}\right)+30 \psi^{\prime} t^{\prime 2}+3 t^{\prime 4}\right]
$$

$$
+t^{\prime} \frac{x^{7}}{315}\left(17+77 t^{\prime 2}+105 t^{\prime 4}+45 t^{\prime 6}\right)
$$

## Transverse Mercator Co-ordinates to Latitude/Longitude

Point Scale Factor
Let $x=\frac{E^{\prime 2}}{\mathrm{k}_{0}^{2} v^{\prime} \rho^{\prime}} \quad$ (note the different value of x for this formula)
$\mathrm{k}=\mathrm{k}_{0}\left(1+\frac{\mathrm{x}}{2}+\frac{\mathrm{x}^{2}}{24}\left(4 \psi^{\prime}\left(1-6 \mathrm{t}^{\prime 2}\right)-3\left(1-16 \mathrm{t}^{\prime 2}\right)-\frac{24 \mathrm{t}^{\prime 2}}{\psi^{\prime}}\right)+\frac{\mathrm{x}^{3}}{720}\right)$
Given these values, the latitude and grid convergence are converted to degrees, minutes and seconds, while $\omega$ is converted to the longitude, $\lambda$, using the formula below, and then converted to degrees, minutes and seconds.

$$
\lambda=\omega+\lambda_{0}
$$

## Sample Computations

## Example 1

Using the SPCS $1983\left(\mathrm{a}=6,378,137 \mathrm{~m}, \mathrm{e}^{2}=0.0066943800\right)$, the following results are obtained.
Nevada East Zone, 2701, $\lambda_{0}=-115^{\circ} 35^{\prime}, \phi_{0}=34^{\circ} 45^{\prime}, \mathrm{k}_{0}=0.999900, \mathrm{E}_{0}=200,000.000 \mathrm{~m}$, $\mathrm{N}_{0}=8,000,000.000 \mathrm{~m}$.
$\begin{array}{ll}\text { Easting }(\mathrm{E})=185,603.123 \mathrm{~m} & \text { Northing }(\mathrm{N})=8,739,929.417 \mathrm{~m} \\ \text { Latitude }=41^{\circ} 25^{\prime} 00^{\prime \prime} .000 & \text { Longitude }=-115^{\circ} 45^{\prime} 20 " .000\end{array}$
Grid Convergence $(\gamma)=0^{\circ} 06^{\prime} 50.1^{\prime \prime} \quad$ Point Scale Factor $(k)=0.99990255$

## Example 2

Using the SPCS $1927\left(\mathrm{a}=20925832.2 \mathrm{ft}, \mathrm{e}^{2}=0.00676866\right)$, the following results are obtained.
Nevada East Zone, SPCS 1927, $\lambda_{0}=-115^{\circ} 35^{\prime}, \phi_{0}=34^{\circ} 45^{\prime}, \mathrm{k}_{0}=0.999900, \mathrm{E}_{0}=500,000.000 \mathrm{ft}$, $\mathrm{N}_{0}=0.000 \mathrm{ft}$.

| Easting $(\mathrm{E})=452,764.960 \mathrm{ft}$ | Northing $(\mathrm{N})=2,427,533.222 \mathrm{ft}$ |
| :--- | :--- |
| Latitude $=41^{\circ} 25^{\prime} 00^{\prime \prime} .000$ | Longitude $=-115^{\circ} 45^{\prime} 20^{\prime \prime} .000$ |
| Grid Convergence $(\gamma)=0^{\circ} 06^{\prime} 50.1^{\prime \prime}$ | Point Scale Factor $(\mathrm{k})=0.99990255$ |

## Example 3

Using the ANS ellipsoid ( $\mathrm{a}=6,378,160 \mathrm{~m}, \mathrm{e}^{2}=0.006694541855$ ), the following results are obtained.
AMG Zone 54,

$$
\begin{aligned}
& \lambda_{0}=+141^{\circ} 00^{\prime}, \phi_{0}=0^{\circ} 00^{\prime}, \mathrm{k}_{0}=0.999600 \\
& \mathrm{E}_{0}=500,000.000 \mathrm{~m}, \mathrm{~N}_{0}=10,000,000.000 \mathrm{~m}
\end{aligned}
$$

Easting $(\mathrm{E})=758,053.090 \mathrm{~m}$
Latitude $=-37^{\circ} 39^{\prime} 15^{\prime \prime} .557$
Northing $(N)=5,828,496.973 \mathrm{~m}$
Longitude $=+143^{\circ} 55^{\prime} 30^{\prime \prime} .6330$

Transverse Mercator Co-ordinates to Latitude/Longitude
Grid Convergence $(\gamma)=+1^{\circ} 47^{\prime} 16.67^{\prime \prime} \quad$ Point Scale Factor $(k)=1.00042030$

## Example 4

Using the WGS-72 ellipsoid $\left(\mathrm{a}=6,378,135 \mathrm{~m}, \mathrm{e}^{2}=0.006694317778\right)$, the following results are obtained.

UTM Zone 58, $\quad \lambda_{0}=+165^{\circ} 00^{\prime}, \phi_{0}=0^{\circ} 00^{\prime}, \mathrm{k}_{0}=0.999600$, $\mathrm{E}_{0}=500,000.000 \mathrm{~m}, \mathrm{~N}_{0}=10,000,000.000 \mathrm{~m}$.

Easting $(E)=758,053.090 \mathrm{~m} \quad$ Northing $(N)=5,828,496.973 \mathrm{~m}$
Latitude $=-37^{\circ} 39^{\prime} 15^{\prime \prime} .557 \quad$ Longitude $=+143^{\circ} 55^{\prime} 30^{\prime \prime} .6330$
Grid Convergence $(\gamma)=+1^{\circ} 47^{\prime} 16.67^{\prime \prime} \quad$ Point Scale Factor $(k)=1.00042030$
These last two sets of results agree with those computed in the AGD Technical Manual, 1986.

## Running the Program

Press XEQ Y, then the ENTER key, to start the program. The calculator briefly displays TM 2 LAT-LONG, then briefly shows CHECK-ENTER A. This is "Point A," discussed below. The program then stops and displays the prompt for entering the semi-major axis value, while displaying the current default value:

A?
6,378,137.0000 (This is for GRS80/WGS84/NAD83)

If you are happy with this value for the semi-major axis of the ellipsoid, press $\mathrm{R} / \mathrm{S}$ to continue. Otherwise. Key in a different value (for a different ellipsoid, e.g., 6378135 for WGS72) and press R/S to continue. (This discussion will use the data from Example 4, in the Sample Computations section, above.)

The calculator briefly displays CHECK-ENTER E. The program then stops and displays the prompt for entering the eccentricity of the ellipsoid, e:

E?
0.00669438 (This is for GRS80/WGS84/NAD83)

If this value for the eccentricity is correct, press $R / S$ to continue. Otherwise, key in a different value (for a different ellipsoid, e.g., 0.006694317778 for WGS-72) and press R/S to continue.

The calculator briefly displays CHECK—ENTER K. The program then stops and displays the prompt for entering the scale factor at the central meridian $\left(\lambda_{0}\right)$, which is $\mathrm{k}_{0}$ :

K?
0.9996000
(This is for UTM)

If this value for the scale factor is satisfactory, press R/S to continue. If you want to change it, such as for an SPCS zone, key in the correct value and press R/S.

The calculator briefly displays CHK—NTR LONG 0. The program then stops and displays the prompt for entering the longitude of the central meridian of the projection, $\lambda_{0}$. Note that in the western hemisphere, this will be a negative value, and should be in HP notation (DDD.MMSS).

## Transverse Mercator Co-ordinates to Latitude/Longitude

D?
$-81.000000$
(This is for UTM Zone 17)
If this is the correct central meridian, press $\mathrm{R} / \mathrm{S}$ to continue, if this is not correct, key in the correct value, in HP notation, then press R/S to continue. In this case, key in 165 for UTM Zone 58 , then press R/S.

The calculator briefly displays CHK - NTR LAT 0 . The program then stops and displays the prompt for entering the latitude of the Northing co-ordinate origin, $\phi_{0}$. For UTM, this is 0.000 (the equator), while for SPCS Zones, it is usually a latitude well south of the zone. The value should be entered in HP notation.

C?
0.000000 (This is for UTM)

If this is the correct latitude base, press R/S to continue. If you want a different value, key in that value and press $\mathrm{R} / \mathrm{S}$ to continue. In this case, press $\mathrm{R} / \mathrm{S}$ to continue.

The calculator briefly displays CHK-NTR E 0 . The program then stops and prompts for entry of the false easting value, or the easting offset, denoted $\mathrm{E}_{0}$. This is the value of the easting co-ordinate at the central meridian, $\lambda_{0}$. For UTM, this is $500,000.0000$, while its value varies for different SPCS zones.

I?
500,000.0000 (This is for UTM)
If this is the correct value, press $R / S$ to continue. If a different value is desired, key in the value and press R/S. In this case, press R/S to continue.

The calculator briefly displays $\mathrm{CHK}-\mathrm{NTR} \mathrm{N} 0$. The program then stops and prompts for the false northing value, or the northing offset. This is the value of the northing at the point $\phi_{0}, \lambda_{0}$, denoted $\mathrm{N}_{0}$.

J ?
0.0000
(This is for UTM in the northern hemisphere)
If this is the correct value, press $R / S$ to continue. If a different value is required, key in the value and press $\mathrm{R} / \mathrm{S}$. In this case, key in $10,000,000.000$ and press $\mathrm{R} / \mathrm{S}$. This is the $\mathrm{N}_{0}$ value for UTM in the southern hemisphere.

This is "Point B," discussed below. The calculator briefly displays ENTER EASTING. The program stops and displays the prompt for entering the easting of the point to be converted.

```
X?
0.0000
```

Key in the easting of the point and press R/S to continue. In this case, key in 787420.487 and press R/S.
The calculator briefly displays ENTER NORTHING. The program then stops and displays the prompt for entering the northing of the point to be converted.

```
Y?
0.0000
```

Key in the northing of the point and press R/S to continue. In this case, key in 6782165.201 and press R/S.

The program displays RUNNING for some little time, then displays RESULTS briefly, followed by LATITUDE briefly. The program then stops and displays the latitude value of the point, in HP notation. In this case, the calculator displays:

$$
\begin{aligned}
& \mathrm{F}= \\
& -29.03231530
\end{aligned}
$$

This is the latitude of the point, in this case being $29^{\circ} 03^{\prime} 23^{\prime \prime} .1530 \mathrm{~S}$ in more conventional notation. Press $\mathrm{R} / \mathrm{S}$ to continue. The calculator briefly displays LONGITUDE, then stops and displays the longitude value of the point, in HP notation. In this case, the calculator displays:

L=
167.57066320

This is the longitude of the point, in this case being $167^{\circ} 57^{\prime} 06 " .6320 \mathrm{E}$ in more conventional notation. Press R/S to continue. The calculator briefly displays GRID CONV, then stops and displays the grid convergence value in HP notation. In this case, the calculator displays:
$\mathrm{G}=$
1.26045907

This is the grid convergence in HP notation, and is $1^{\circ} 26^{\prime} 04 " .59$ in more conventional notation. Press R/S to continue. The calculator briefly displays PT SCALE FACT, then stops and displays the point scale factor of the point on the Transverse Mercator projection. In this case, the calculator displays:

```
S=
1.00061955
```

This is the point scale factor. Press R/S to continue.
You now have the choice of running one or more additional points. The calculator briefly displays NEXT PT [ $0-1$ ], then stops and displays the prompt for answering questions:

Q?
0.0000

If you want to quit the program, just press R/S. If you want to enter more points, key in 1 and press R/S. In this case, the calculator then prompts to see if you want to use the same parameters. The calculator briefly displays NEW ZONE [ $0-1$ ], then stops at the question prompt:

Q?
0.0000

If you want to go to a new zone, key in 1 and press $\mathrm{R} / \mathrm{S}$, and the calculator will take you to the point where you can change any of the values (Point A above), starting with the ellipsoid parameters. If you want to work in the same zone already entered, just press R/S, and the program will take you to "Point B" and prompt for the latitude of the point to be converted, and continue from there. You can go around the program as many times as necessary.

When you choose to end the program, the calculator briefly displays PROGRAM END and then comes to an end, returning to the point from which it was called, or to normal operations, and resetting Flag 10.

Transverse Mercator Co-ordinates to Latitude/Longitude

## Storage Registers Used

A Semi-major axis of the ellipsoid being used, a
B Semi-minor axis of the ellipsoid being used, b
C $\quad \phi_{0}$, the origin latitude for the co-ordinates
D $\quad \lambda_{0}$, the central meridian of the projection
E Eccentricity of the ellipsoid, $\mathrm{e}^{2}$
F $\quad \phi$ ', foot-point latitude, then $\phi$, latitude of the point that has been converted
G $\quad \gamma$, the grid convergence of the point being converted
$\mathbf{H} \quad$ meridian distance of the origin latitude, $\phi_{0}$
I $\quad \mathrm{E}_{0}$, the offset for the eastings (the easting at $\boldsymbol{\lambda}_{\mathbf{0}}$ )
$\mathbf{J} \quad \mathrm{N}_{0}$, the offset for the northings (the northing at $\phi_{0}, \boldsymbol{\lambda}_{\mathbf{0}}$ )
$\mathbf{K} \quad \mathrm{k}_{0}$, the scale factor along the central meridian, $\boldsymbol{\lambda}_{\mathbf{0}}$
$\mathbf{L} \quad \lambda$, longitude of the point that has been converted
M m, preliminary meridian distance of the point to be converted
N $\quad v^{\prime}$
O n , a constant for the ellipsoid
P $\quad \psi^{\prime}=\frac{v^{\prime}}{\rho^{\prime}}$
Q used for getting responses to questions about running more points
R $\quad \rho$
S $\quad \sigma$, an intermediate value; then k , point scale factor at the point being converted
T $\quad \tan \phi$
U $\quad \mathrm{x}=\mathrm{E}^{\prime} \div \mathrm{k}_{0} \mathrm{v}^{\prime}$
V $\mathrm{m}_{0}$, the meridian distance to $\phi_{0}$
W $\quad \omega=\lambda-\lambda_{0}$
$\mathbf{X} \quad$ Easting co-ordinate of point to be converted
Y Northing co-ordinate of point to be converted
Statistical Registers: not used

## Labels Used

Label $\mathbf{Y} \quad$ Length $=1707$
Checksum $=72 \mathrm{~F} 1$
Use the length ( $\mathrm{LN}=$ ) and Checksum ( $\mathrm{CK}=$ ) values to check if program was entered correctly. Use the sample computations to check proper operation after entry.

## Flags Used

Flags 1 and 10 are used by this program. Flag 10 is set for this program, so that equations can be shown as prompts. Flag 1 is used to record the setting of Flag 10 before the program begins. At the end of the program, Flag 10 is reset to its original value, based on the value in Flag 1.

Transverse Mercator Co-ordinates to Latitude/Longitude

## Parameters for the Computations

## Universal Transverse Mercator (UTM)

For UTM, the $\phi_{0}$ value is $0^{\circ}$ (the equator) for both northern and southern hemispheres. The $\lambda_{0}$ values are given for each zone in the table below.

| Zone | Central Meridian, $\lambda_{0}$ | Zone | Central Meridian, $\lambda_{0}$ |
| :---: | :---: | :---: | :---: |
| 1 | $177^{\circ} \mathrm{W}$ | 31 | $3^{\circ} \mathrm{E}$ |
| 2 | $171^{\circ} \mathrm{W}$ | 32 | $9^{\circ} \mathrm{E}$ |
| 3 | $165^{\circ} \mathrm{W}$ | 33 | $15^{\circ} \mathrm{E}$ |
| 4 | $159^{\circ} \mathrm{W}$ | 34 | $21^{\circ} \mathrm{E}$ |
| 5 | $153^{\circ} \mathrm{W}$ | 35 | $27^{\circ} \mathrm{E}$ |
| 6 | $147^{\circ} \mathrm{W}$ | 36 | $33^{\circ} \mathrm{E}$ |
| 7 | $141^{\circ} \mathrm{W}$ | 37 | $39^{\circ} \mathrm{E}$ |
| 8 | $135^{\circ} \mathrm{W}$ | 38 | $45^{\circ} \mathrm{E}$ |
| 9 | $129^{\circ} \mathrm{W}$ | 39 | $51^{\circ} \mathrm{E}$ |
| 10 | $123^{\circ} \mathrm{W}$ | 40 | $57^{\circ} \mathrm{E}$ |
| 11 | $117^{\circ} \mathrm{W}$ | 41 | $63^{\circ} \mathrm{E}$ |
| 12 | $111^{\circ} \mathrm{W}$ | 42 | $69^{\circ} \mathrm{E}$ |
| 13 | $105^{\circ} \mathrm{W}$ | 43 | $75^{\circ} \mathrm{E}$ |
| 14 | $99^{\circ} \mathrm{W}$ | 44 | $81^{\circ} \mathrm{E}$ |
| 15 | $93^{\circ} \mathrm{W}$ | 45 | $87^{\circ} \mathrm{E}$ |
| 16 | $87^{\circ} \mathrm{W}$ | 46 | $93^{\circ} \mathrm{E}$ |
| 17 | $81^{\circ} \mathrm{W}$ | 47 | $99^{\circ} \mathrm{E}$ |
| 18 | $75^{\circ} \mathrm{W}$ | 48 | $105^{\circ} \mathrm{E}$ |
| 19 | $69^{\circ} \mathrm{W}$ | 49 | $111^{\circ} \mathrm{E}$ |
| 20 | $63^{\circ} \mathrm{W}$ | 50 | $117^{\circ} \mathrm{E}$ |
| 21 | $57^{\circ} \mathrm{W}$ | 51 | $123^{\circ} \mathrm{E}$ |
| 22 | $51^{\circ} \mathrm{W}$ | 52 | $129^{\circ} \mathrm{E}$ |
| 23 | $45^{\circ} \mathrm{W}$ | 53 | $135^{\circ} \mathrm{E}$ |
| 24 | $39^{\circ} \mathrm{W}$ | 54 | $141^{\circ} \mathrm{E}$ |
| 25 | $33^{\circ} \mathrm{W}$ | 55 | $147{ }^{\circ} \mathrm{E}$ |
| 26 | $27^{\circ} \mathrm{W}$ | 56 | $153^{\circ} \mathrm{E}$ |
| 27 | $21^{\circ} \mathrm{W}$ | 57 | $159^{\circ} \mathrm{E}$ |
| 28 | $15^{\circ} \mathrm{W}$ | 58 | $165^{\circ} \mathrm{E}$ |
| 29 | $9^{\circ} \mathrm{W}$ | 59 | $171{ }^{\circ} \mathrm{E}$ |
| 30 | $3^{\circ} \mathrm{W}$ | 60 | $177^{\circ} \mathrm{E}$ |

The $E_{0}$ value for all zones is $500,000.000$ meters. The $N_{0}$ value for the northern hemisphere is 0.000 meters. The $\mathrm{N}_{0}$ value for the southern hemisphere is $10,000,000.000$ meters.

Transverse Mercator Co-ordinates to Latitude/Longitude

## State Plane Co-ordinate System (SPCS) 1983

Several US states use the Transverse Mercator projection for SPCS 1983. The various parameters for each zone in the 1983 system are given in the table below. Use these parameters with the program, together with the GRS80/WGS84/NAD83 ellipsoid parameters, in meters.

| Central | Latitude |  | False |  |
| :---: | :---: | :---: | :---: | :---: |
| Meridian | Origin | Central Scale False Easting | Northing |  |
| $\lambda_{\mathrm{o}}$ | $\phi_{0}$ | $\mathrm{k}_{0}$ | $\mathrm{E}_{0}(\mathrm{~m})$ | $\mathrm{N}_{0}(\mathrm{~m})$ |

| Alabama |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| East | $85^{\circ} 50^{\prime}$ | $30^{\circ} 30^{\prime}$ | 0.9999600 | 200000.00 | 0.00 |  |
| West | $87^{\circ} 30^{\prime}$ | $30^{\circ} 00^{\prime}$ | 0.9999333 | 600000.00 | 0.00 |  |

## State Plane Co-ordinate System (SPCS) 1927

Several US states used the Transverse Mercator projection for SPCS 1927. The various parameters for each zone in the 1927 system are given in the table below. Use these parameters with the program, together with the Clarke 1866 ellipsoid in feet.

|  | Central <br> Meridian <br> $\lambda_{0}$ | Latitude <br> Origin <br> $\phi_{0}$ | Central <br> Scale <br> $\mathrm{k}_{0}$ | False Easting <br> $\mathrm{E}_{0}(\mathrm{ft})$ | False <br> Northing <br> $\mathrm{N}_{0}(\mathrm{ft})$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Alabama |  |  |  |  |  |
| East | $85^{\circ} 50^{\prime}$ | $30^{\circ} 30^{\prime}$ | 0.9999600 | 500000.00 | 0.00 |
| West | $87^{\circ} 30^{\prime}$ | $30^{\circ} 00^{\prime}$ | 0.9999333 | 500000.00 | 0.00 |
| Alaska |  |  |  |  |  |
| 2 |  |  |  |  |  |
| 3 | $142^{\circ} 00^{\prime}$ | $54^{\circ} 00^{\prime}$ | 0.9999000 | 500000.00 | 0.00 |
| 4 | $146^{\circ} 00^{\prime}$ | $54^{\circ} 00^{\prime}$ | 0.9999000 | 500000.00 | 0.00 |
| 5 | $150^{\circ} 00^{\prime}$ | $54^{\circ} 00^{\prime}$ | 0.9999000 | 500000.00 | 0.00 |

## Ellipsoids

There are a range of ellipsoids in common or former use. The table below has the a and $\mathrm{e}^{2}$ values for a number of common (and less common) ellipsoids.

| Ellipsoid | a Semi-major Axis | $\mathrm{e}^{2}$ Eccentricity |
| :---: | :---: | :---: |
| GRS80-WGS94-NAD83 | 6378137 m | 0.00669438 |
| Clarke 1866 (NAD27) | 6378206.4 m | 0.00676866 |
| Clarke 1866 (NAD27) | 20925832.2 ft | 0.00676866 |
| ANS (Australian) | 6378160 m | 0.006694541855 |
| Airy 1830 | 6377563.4 m | 0.00667054 |
| Bessel 1841 | 6377397.16 m | 0.006674372 |
| Clarke 1880 | 6378249.15 m | 0.006803511 |
| Everest 1830 | 6377276.35 m | 0.006637847 |
| Fischer 1960 (Mercury) | 6378166 m | 0.006693422 |
| Fischer 1968 | 6378150 m | 0.006693422 |
| Hough 1956 | 6378270 m | 0.00672267 |
